

# Testing guidelines for the sheet - Country-wise categorization

This sheet focuses on the Country-wise data and looks as shown below.

There is one thing to keep in mind while going through the various visualizations in this sheet, which is, the participation of each country varies for the OECD survey, and hence, the gender count cannot be treated as the sole parameter to compare with the other countries.

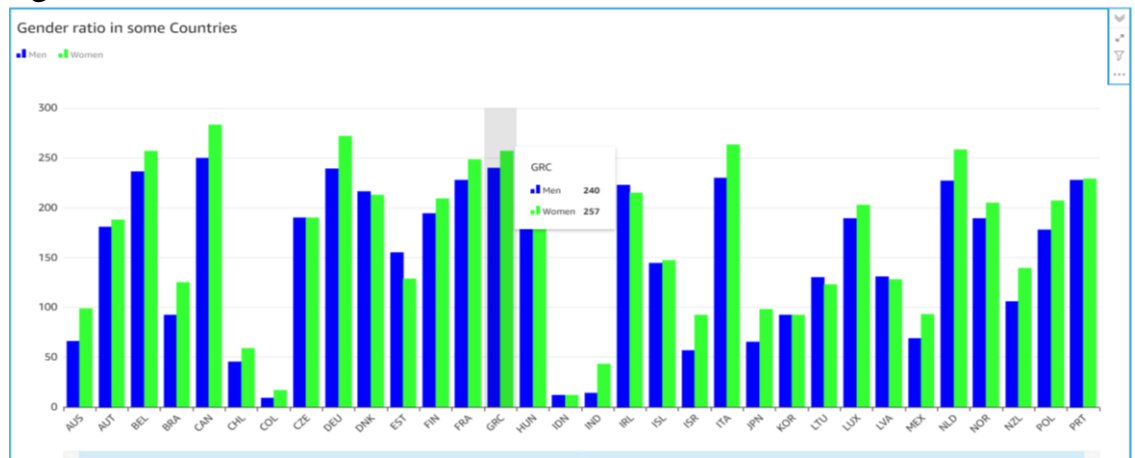

The four visualizations in this sheet are

- i. **Gender ratio in some Countries** – This is a bar graph visualization which helps compare the difference in the count of the two genders with each other as well as with the gender ratio of other countries.
- ii. **Country-wise Data** – In the rest of the sheet there are many pie-charts which show the gender ratio of that particular country taking part in the survey over the years. From these pie-charts one can easily conclude the difference between the gender ratios of that particular country.

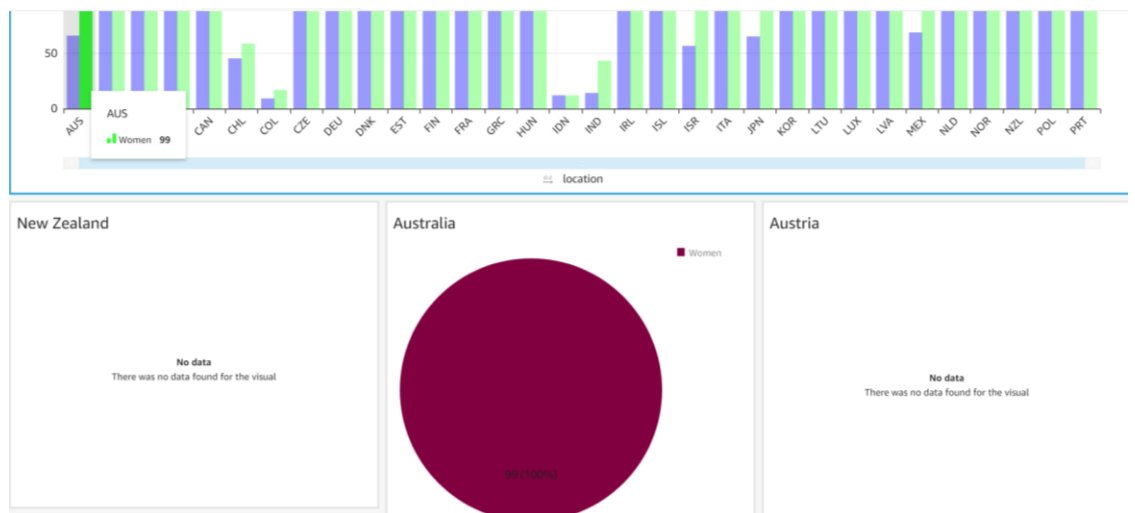

Step 1 - Click on any visualization to get further access to it.

## 1.1 Gender ratio in some Countries

- i. Hover over the bar of a particular country to know more about its gender distribution.

- ii. Further, you can also click on a single gender's bar to display the chart of only that gender in that country.

## 1.2 Country-wise Data

- i. Scroll through the remaining sheet to check out the gender ratio of all the countries distinct.
